About Slime Child Audio

Slime Child Audio is a new audio tools company creating high-quality, finely-engineered synthesizers and audio effects. We strive to build polished, unique, and inventive tools that help musicians and sound designers do their best work. Slime Child Audio uses state-of-the-art DSP and circuit design techniques along with highly-optimized code and carefully-built user interfaces to ensure our products sound as incredible as possible at a low price.

Slime Child Audio was founded in 2020 by Coriander V. Pines, who is currently the sole employee. Coriander started Slime Child Audio as a way to combine their background in mathematics, media art, game development, and electrical engineering into tools that help foster creativity in others. Our flagship product, Substation for VCV Rack, was released in January, 2021 and promises to be an exciting addition to any synthesizer enthusiast's sonic palette. In the coming years, we hope to expand our range of products to include hardware modules, VST plugins, and standalone music software.

Slime Child Audio is committed to supporting musicians, sound designers, and aspiring plugin creators no matter their budget. All of our products are sold at prices below industry standard, and we provide additional community support discounts when requested. We also pledge to release free, open source versions of our products within a year of their release.
